Proposed / Product Design

Detailed Logic Board

Merchant-facing steps, backend / internal steps, external provider calls, decisions, reused results, outcomes and open decisions. One panel per area.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

1. **A · Know Your Business (Page 1): Eligible or Not Eligible** — No identity, mobile, OTP or URL. Only two outcomes. Revenue is collected but never routes (risk input only). The declared category is preliminary; it is replaced by the government activity once retrieved.
2. **B · Identifier + mobile, existence check, OTP and routing** — Only a Registered Business or a Freelancer with a certificate reaches Page 2. An internal lookup decides where the code goes. Existing records open only with the REGISTERED mobile. There is no Sales-lead route.
3. **C · Business Verification: registered business** — CR data and owners / managers are retrieved in the backend once and reused. The merchant sees a screen only when they must act. CR age feeds the risk score; it never rejects.
4. **D · Business Verification: Freelancer** — Cost order (rule flag ON): the backend checks that a certificate exists BEFORE Nafath, silently. The applicant still sees Nafath → certificate; no certificate detail is shown before Nafath.
5. **E · Mobile ↔ National ID, then Nafath (registered business and Freelancer)** — Send to Nafath first confirms that the verified mobile belongs to the verifying person (authorized_person_mobile_verified). A mismatch never restarts onboarding: CR data, eligibility, selection and progress are kept.
6. **F · Business Details** — Store presence for the channel declared on Page 1 (fraud / presence evidence). Google Maps = actual selling branch, not the National Address. Freelancers verify the IBAN linkage.
7. **G · Commercial Offer** — Your Standard Offer → Continue. The rate comes from the VERIFIED category. A better-rate review is optional, collapsed and low-priority; the interest is kept even with no file.
8. **H · Review: locked sections, transactional edit** — Verified and sensitive sections are locked. Only store presence and the rate-review request can be edited: changes stay in a draft until Save; Cancel restores the whole application; nothing is invalidated before Save.
9. **I · Contract, submission and Application Progress** — Back to Review, or one action: Agree & Submit records acceptance and submits (no Decline). A submitted application opens Application Progress — never Review, Contract or a second submission. No activation is claimed before it happens.
10. **J · Resume, reuse, invalidation and freshness** — Ordinary resume costs one OTP to the registered mobile. Positive results are reused until a dependency changes; negative and technical results follow a policy per result type.

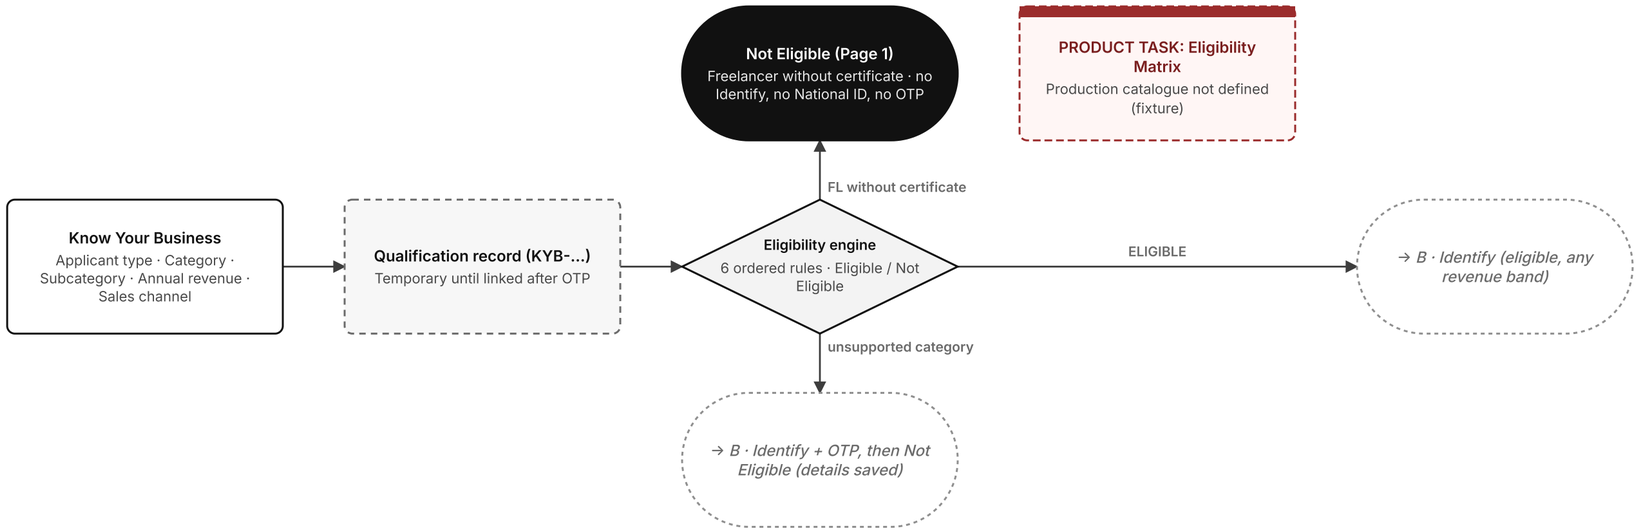

Successful CR / owner / mobile / Nafath / certificate / IBAN checks are reused. Resume normally costs one OTP to the registered mobile.

Proposed / Product Design

A · Know Your Business (Page 1): Eligible or Not Eligible

No identity, mobile, OTP or URL. Only two outcomes. Revenue is collected but never routes (risk input only). The declared category is preliminary; it is replaced by the government activity once retrieved.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

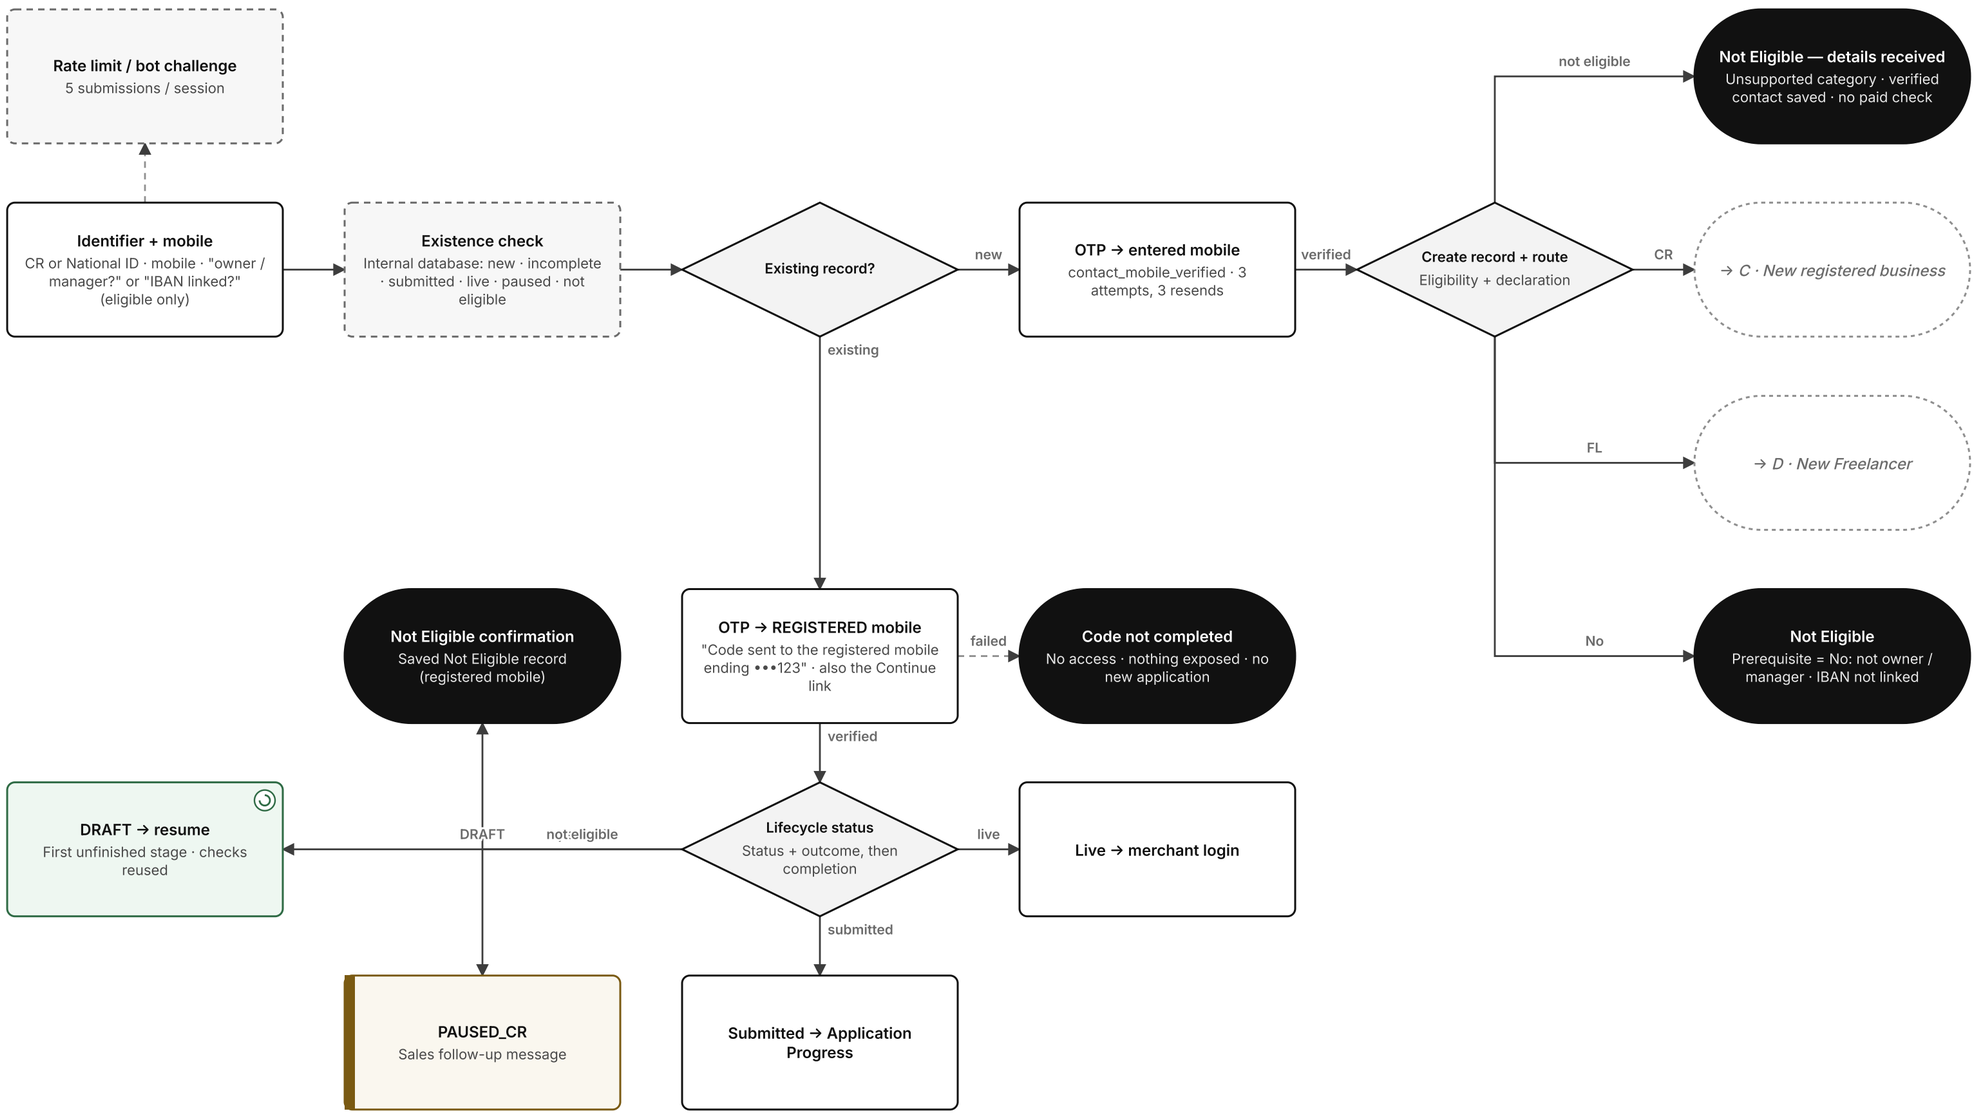

Removed: Sales-lead, Blocked and manual-review routes; revenue routing (below SAR 100K / above SAR 20M). Website and Google Maps links are in Business Details.

Proposed / Product Design

B · Identifier + mobile, existence check, OTP and routing

Only a Registered Business or a Freelancer with a certificate reaches Page 2. An internal lookup decides where the code goes. Existing records open only with the REGISTERED mobile. There is no Sales-lead route.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

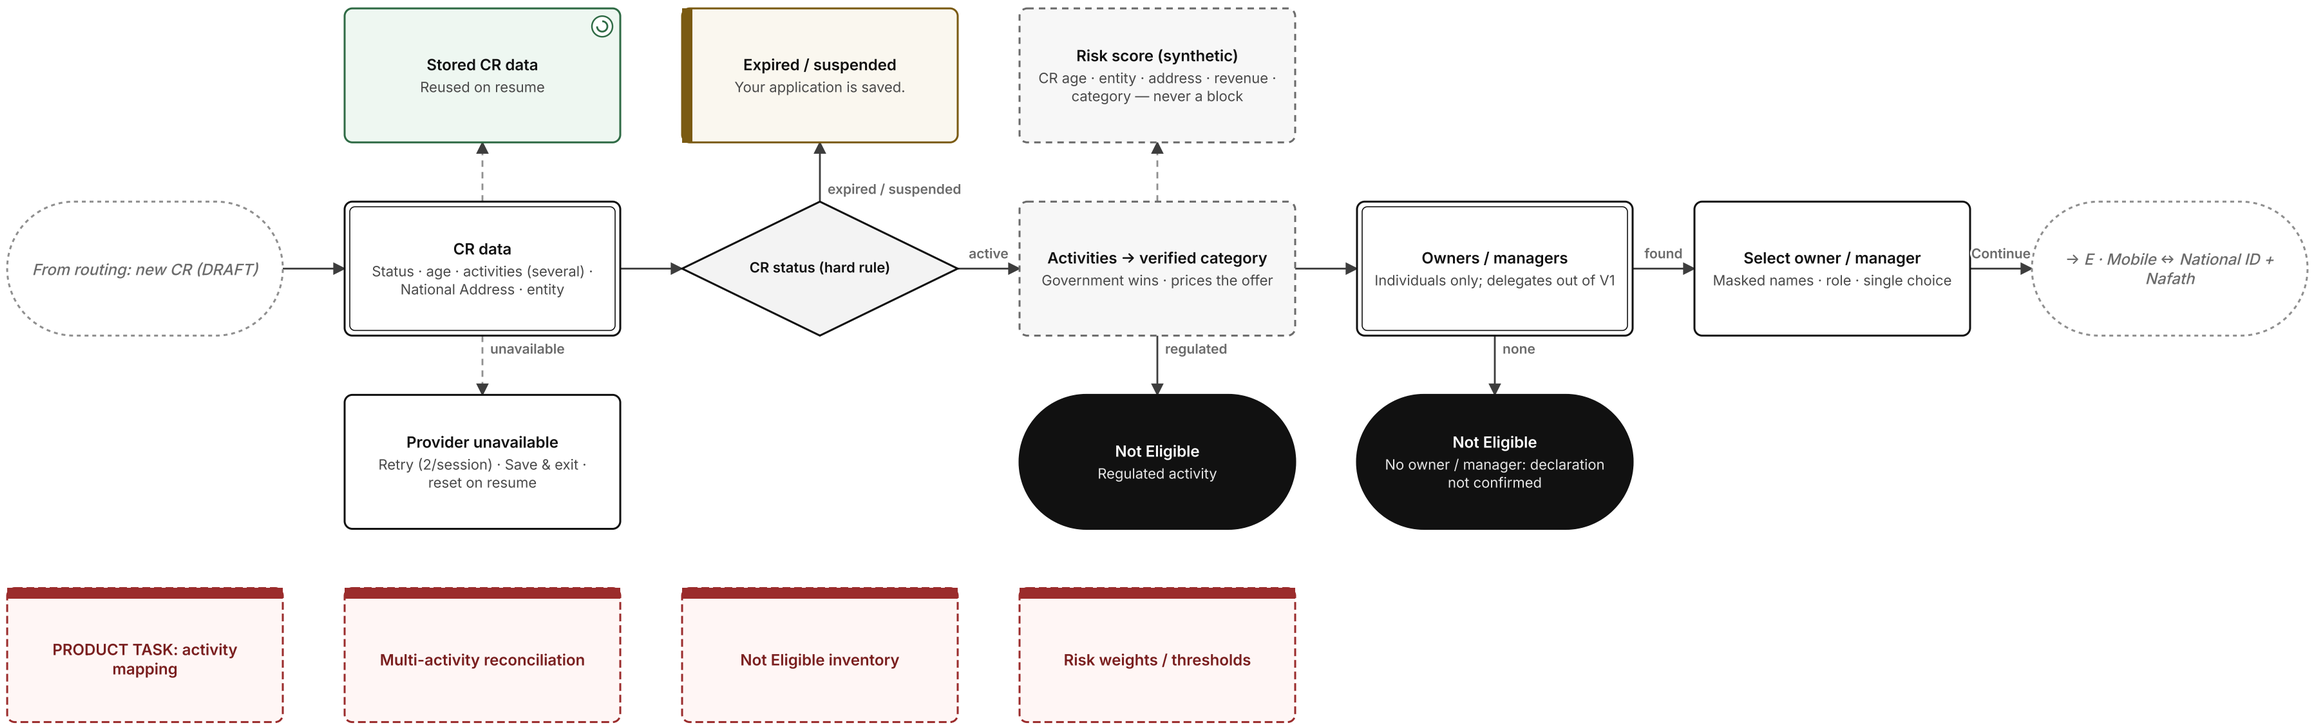

Proposed / Product Design

C · Business Verification: registered business

CR data and owners / managers are retrieved in the backend once and reused. The merchant sees a screen only when they must act. CR age feeds the risk score; it never rejects.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

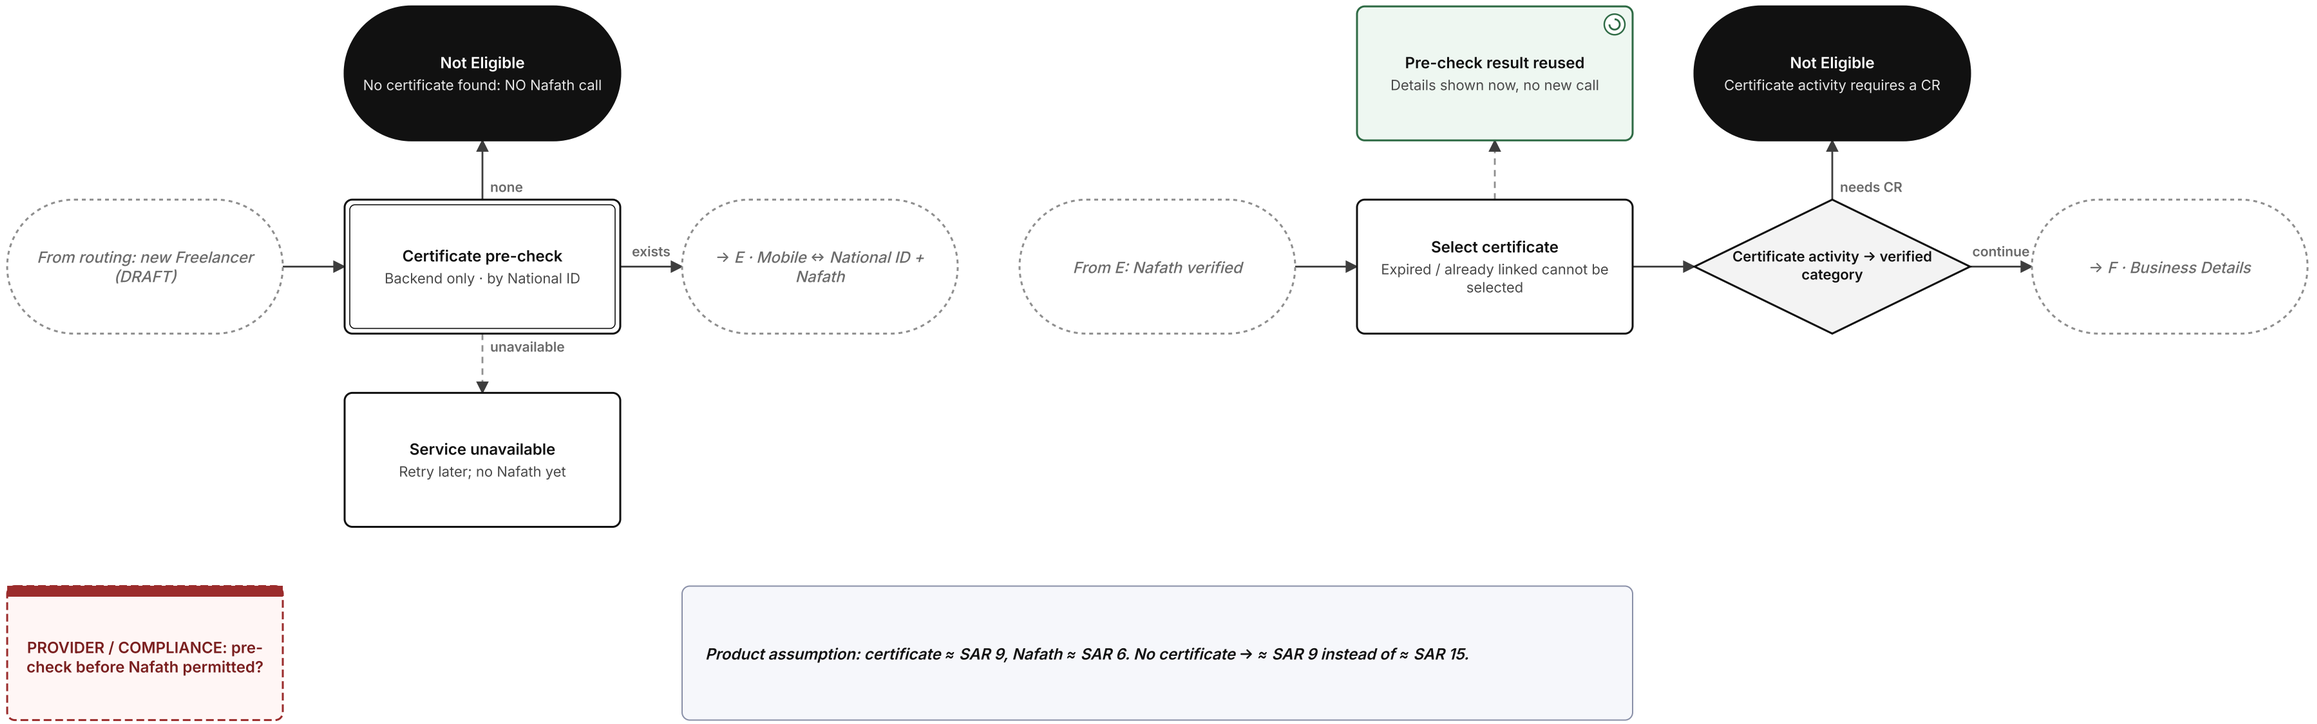

Proposed / Product Design

D · Business Verification: Freelancer

Cost order (rule flag ON): the backend checks that a certificate exists BEFORE Nafath, silently. The applicant still sees Nafath → certificate; no certificate detail is shown before Nafath.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

PROVIDER / COMPLIANCE: pre-check before Nafath permitted?

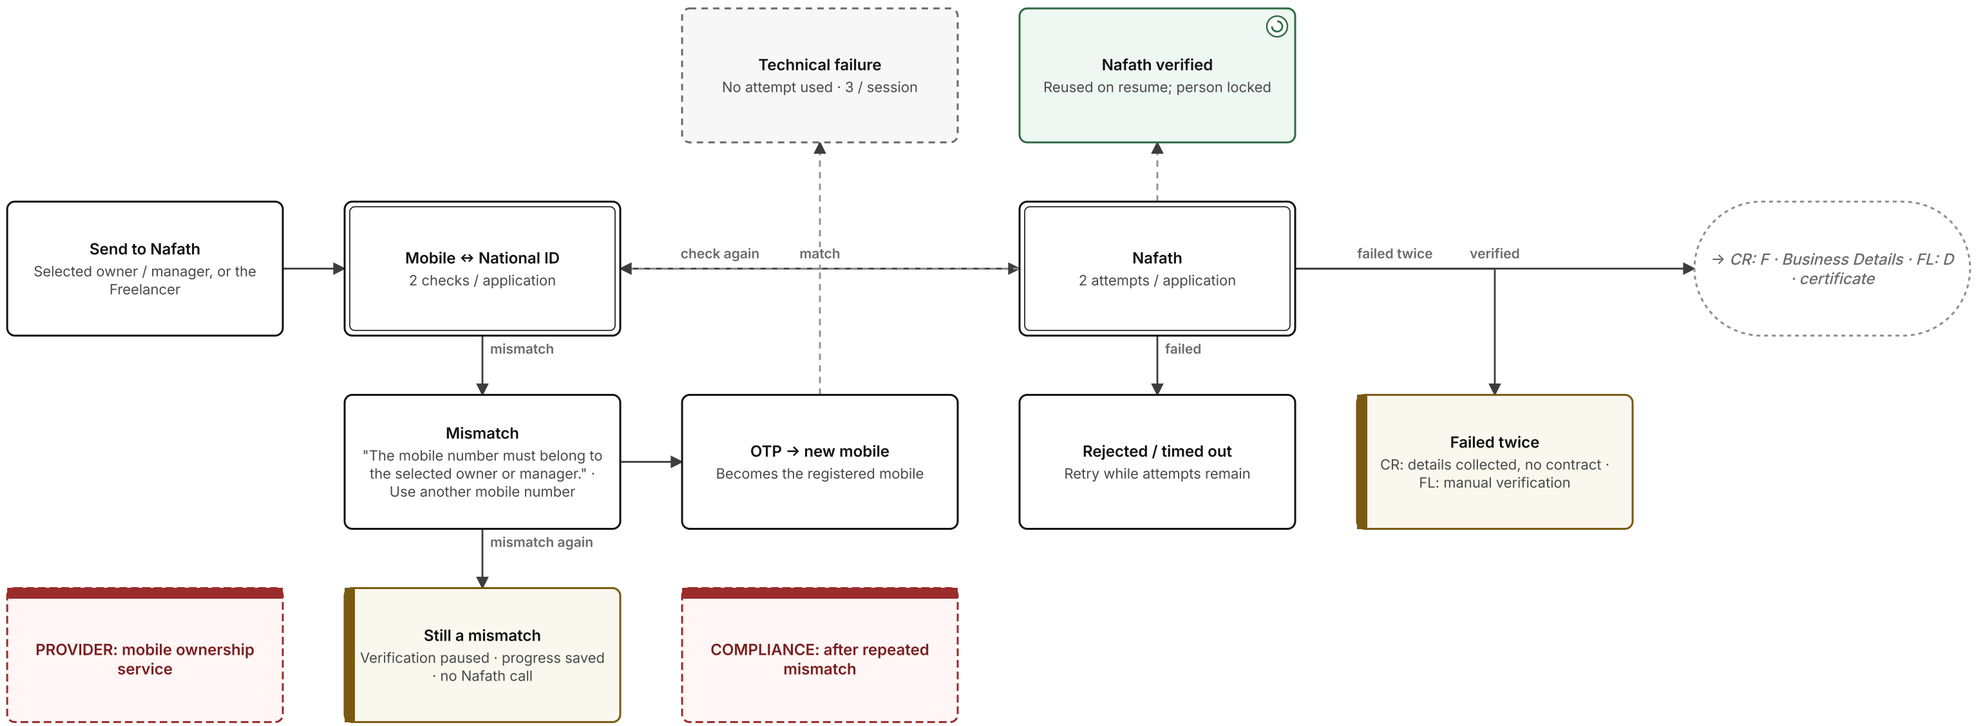

Product assumption: certificate ≈ SAR 9, Nafath ≈ SAR 6. No certificate → ≈ SAR 9 instead of ≈ SAR 15.

Proposed / Product Design

E · Mobile ↔ National ID, then Nafath (registered business and Freelancer)

Send to Nafath first confirms that the verified mobile belongs to the verifying person (authorized_person_mobile_verified). A mismatch never restarts onboarding: CR data, eligibility, selection and progress are kept.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

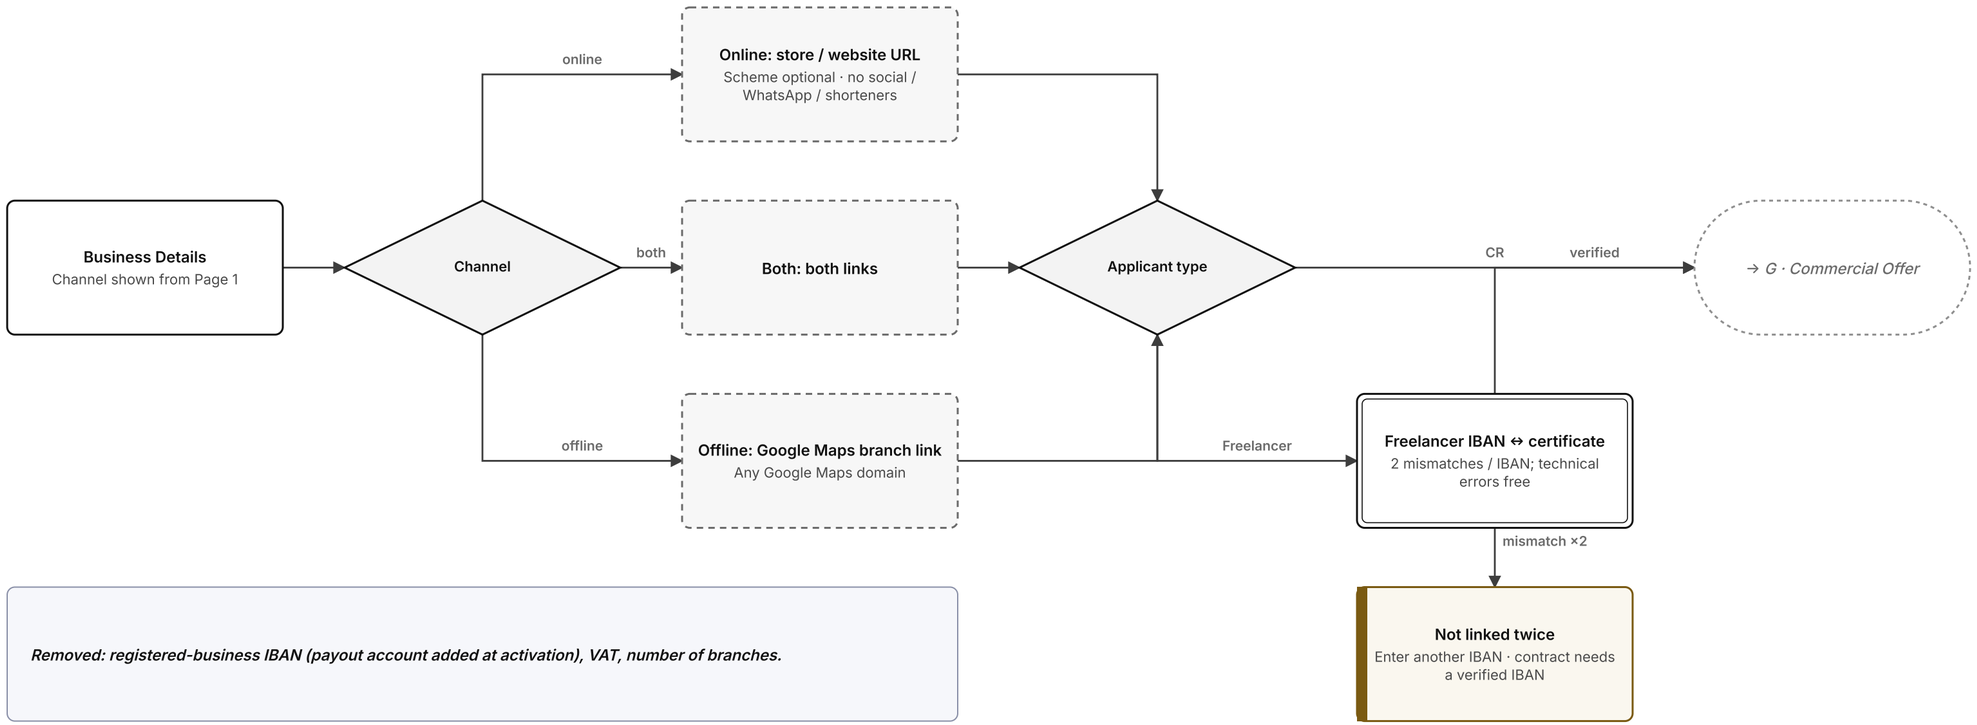

Proposed / Product Design

F · Business Details

Store presence for the channel declared on Page 1 (fraud / presence evidence). Google Maps = actual selling branch, not the National Address. Freelancers verify the IBAN linkage.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

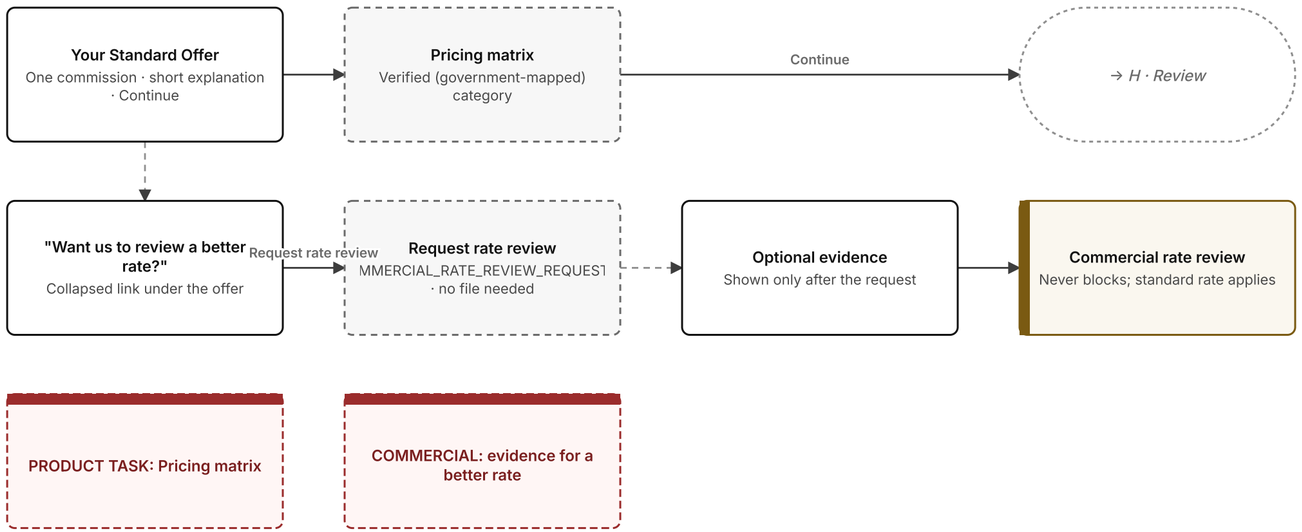

Proposed / Product Design

G · Commercial Offer

Your Standard Offer → Continue. The rate comes from the VERIFIED category. A better-rate review is optional, collapsed and low-priority; the interest is kept even with no file.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

Removed: payment-plan selection (3 / 4 / 6 / 9 / 12 months) — configured later in the Merchant Portal.

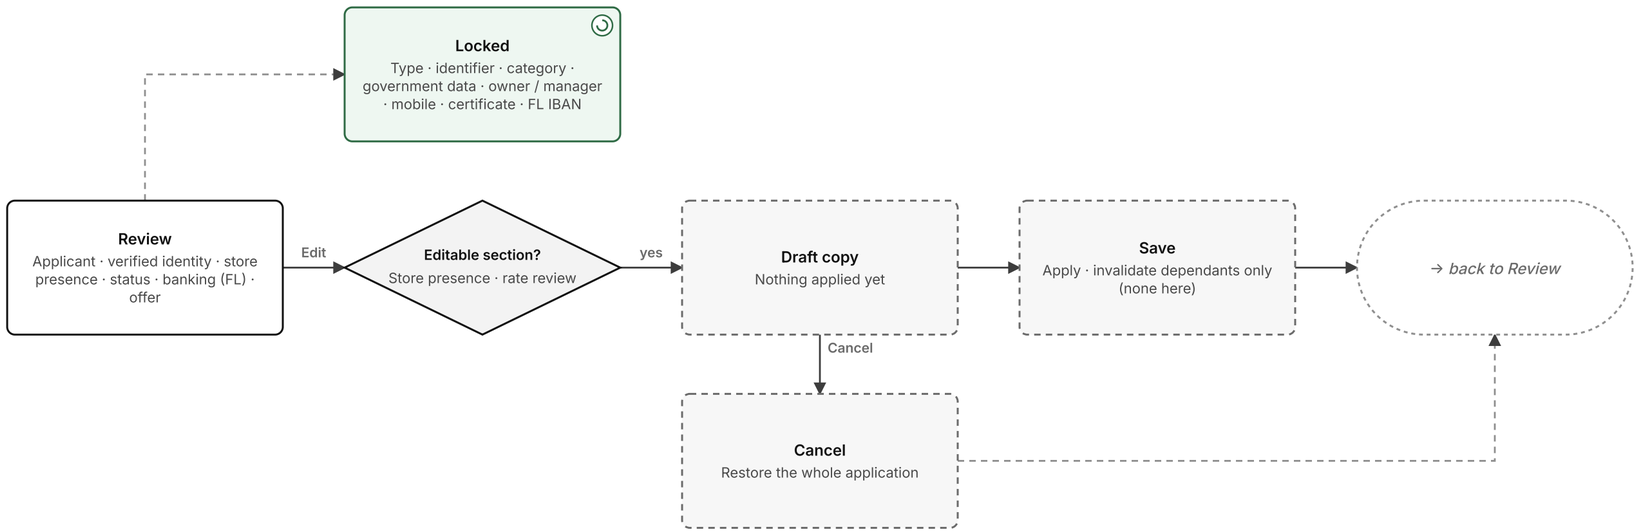

Proposed / Product Design

H · Review: locked sections, transactional edit

Verified and sensitive sections are locked. Only store presence and the rate-review request can be edited: changes stay in a draft until Save; Cancel restores the whole application; nothing is invalidated before Save.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

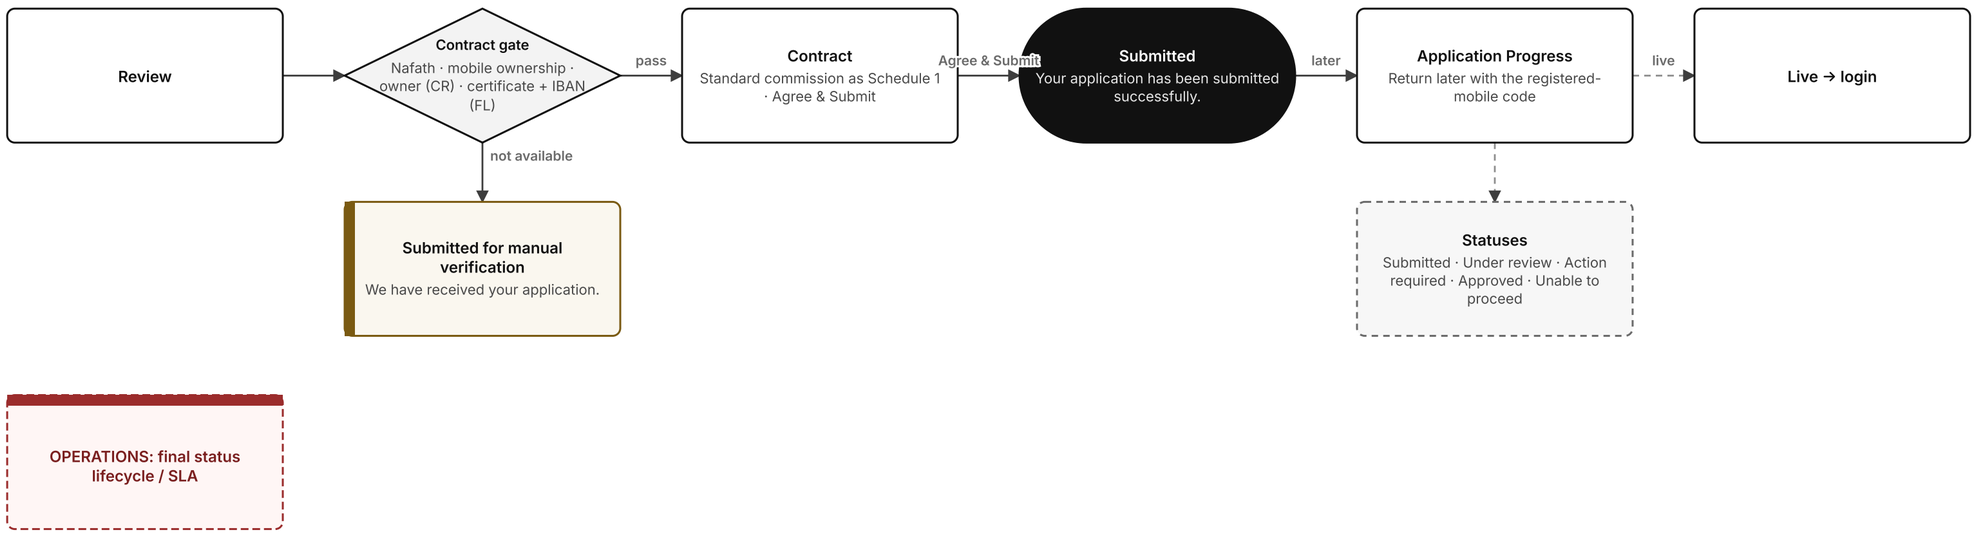

Proposed / Product Design

I · Contract, submission and Application Progress

Back to Review, or one action: Agree & Submit records acceptance and submits (no Decline). A submitted application opens Application Progress — never Review, Contract or a second submission. No activation is claimed before it happens.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

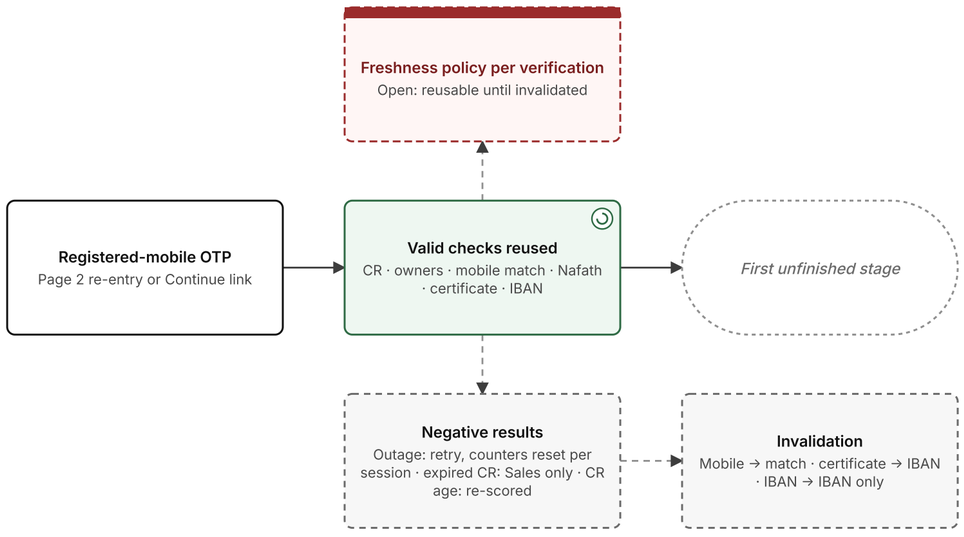

Proposed / Product Design

J · Resume, reuse, invalidation and freshness

Ordinary resume costs one OTP to the registered mobile. Positive results are reused until a dependency changes; negative and technical results follow a policy per result type.

Merchant-facing step · Decision · Backend / internal step · External / provider call · Reused / locked result · Manual / paused route · Outcome · Open decision · Fallback / reuse / loop

Successful CR / owner / mobile / Nafath / certificate / IBAN checks are reused. Resume normally costs one OTP to the registered mobile.

Proposed / Product Design

Open product and compliance decisions

Product tasks and decisions. Not confirmed rules.

1. OD-1 · PRODUCT TASK **Exact Eligibility Matrix** — Category · subcategory · applicant type · channel · result (Eligible / Not Eligible) · CR / certificate required · regulatory restriction · personalised reason · rule version. Revenue does not decide eligibility. Prototype: fixture catalogue.
2. OD-2 · PRODUCT TASK **Exact government activity → category mapping** — Every activity code → Madfu subcategory (many-to-one). Prototype: synthetic codes.
3. OD-3 · PRODUCT / COMPLIANCE DECISION **Multi-activity reconciliation behaviour** — Which activity wins (primary, any, most restrictive), and what happens when several map to different categories. Prototype: demo order (regulated blocks → match confirms → primary reclassifies → unmapped keeps the declaration).
4. OD-4 · RISK DECISION **Risk scoring weights / formula** — Factors and weights (CR age, status, revenue, category, fraud, credit, compliance). Prototype: synthetic demo weights.
5. OD-5 · PRODUCT / COMPLIANCE DECISION **Not Eligible inventory** — The complete list of regulatory / business conditions that cannot continue, incl. how a restricted CR is handled (prototype: Sales route, provisional).
6. OD-6 · RISK DECISION **Low / Medium / High thresholds and their effect** — Thresholds and what each level changes (review depth, limits, pricing). Prototype: demo thresholds, no effect on the journey.
7. OD-7 · PROVIDER / COMPLIANCE DECISION **Certificate lookup before Nafath** — Whether the freelance platform / privacy rules permit an existence check by National ID before Nafath. Prototype rule flag flCertificatePrecheckBeforeNafath = true.
8. OD-8 · PROVIDER / COMPLIANCE DECISION **Mobile ↔ National ID provider / service behaviour** — Which service confirms mobile ownership, its cost, latency, coverage (e.g. prepaid / non-Saudi numbers) and reuse. Prototype: simulated service.
9. OD-9 · COMPLIANCE DECISION **Behaviour after repeated mobile mismatch** — Prototype: 2 checks per application, then the verification step pauses with progress saved. Whether this escalates, blocks or routes to manual is open.
10. OD-10 · PRODUCT TASK **Exact Pricing & Commission Matrix** — Verified category / subcategory → standard commission; tiers; effective dates. Prototype: synthetic.
11. OD-11 · PRODUCT/COMMERCIAL DECISION **Evidence requested for a better rate** — Which documents or data qualify a rate review, and how an improved rate is applied after the contract. Prototype: two placeholder documents.
12. OD-12 · LEGAL DECISION **Final Freelancer IBAN regulatory / legal wording** — The Page-2 question, the Not Eligible message and the linkage requirement wording.
13. OD-13 · PRODUCT/ENGINEERING DECISION **Freshness rules by verification / result** — How long CR data, people, mobile match, Nafath, certificate and IBAN results stay valid. Prototype: reusable until invalidated; negative results per NEGATIVE_POLICY.
14. OD-14 · OPERATIONS DECISION **Sales / manual recovery workflow after an expired / suspended CR** — Who owns it, how the CR is re-checked after correction (prototype: one controlled re-check by Sales), and how the merchant continues.
15. OD-15 · OPERATIONS DECISION **Final application status lifecycle / SLA** — Statuses after submission (prototype: Submitted, Under review, Action required, Approved, Unable to proceed) and any SLA. None invented.
16. OD-16 · LEGAL DECISION **Authorisation of CR owners / managers** — Whether Legal requires a finer distinction (e.g. signatory powers, partner types) than "owner or manager registered on the CR".
