Proposed / Product Design

Detailed Master Board

Every page, field group, backend decision, provider check, reused verification, manual route, outcome and open decision. One panel per page.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · ---- Fallback / reuse / loop

1. **A · Know Your Business and eligibility** — First page. No CR, National ID, mobile or OTP. Eligibility is evaluated internally before any paid verification.
2. **B · Identify & Verify, duplicates and resume** — Identity after eligibility. The Continue link identifies the application; OTP authorises it. Resume goes to the first incomplete screen.
3. **C1 · Business Verification: Registered business** — Government data is retrieved once and reused. CR 3 months or younger: temporarily not eligible. Declared category is reconciled with the registered activity.
4. **C2 · Business Verification: Freelancer** — Nafath on the National ID, then the certificates are retrieved (never uploaded). Zero documents.
5. **D · Business & Banking Details** — Stage-1 answers are shown, not asked again. Only remaining details. IBAN ownership checked once; reused until the IBAN or its owner changes.
6. **E · Commercial Offer** — All commercial configuration lives here, not in the Contract. Standard commission comes from the pricing matrix; declared revenue never lowers it automatically.
7. **F · Review, Edit and dependency invalidation** — Every section has Edit and returns to Review. An edit invalidates only the verification that depends on the changed field.
8. **G · Contract and Submit / Outcome** — The contract page contains the contract only: agreed commission and plans are shown as contract content, never selected here. Nafath is not the contract provider.

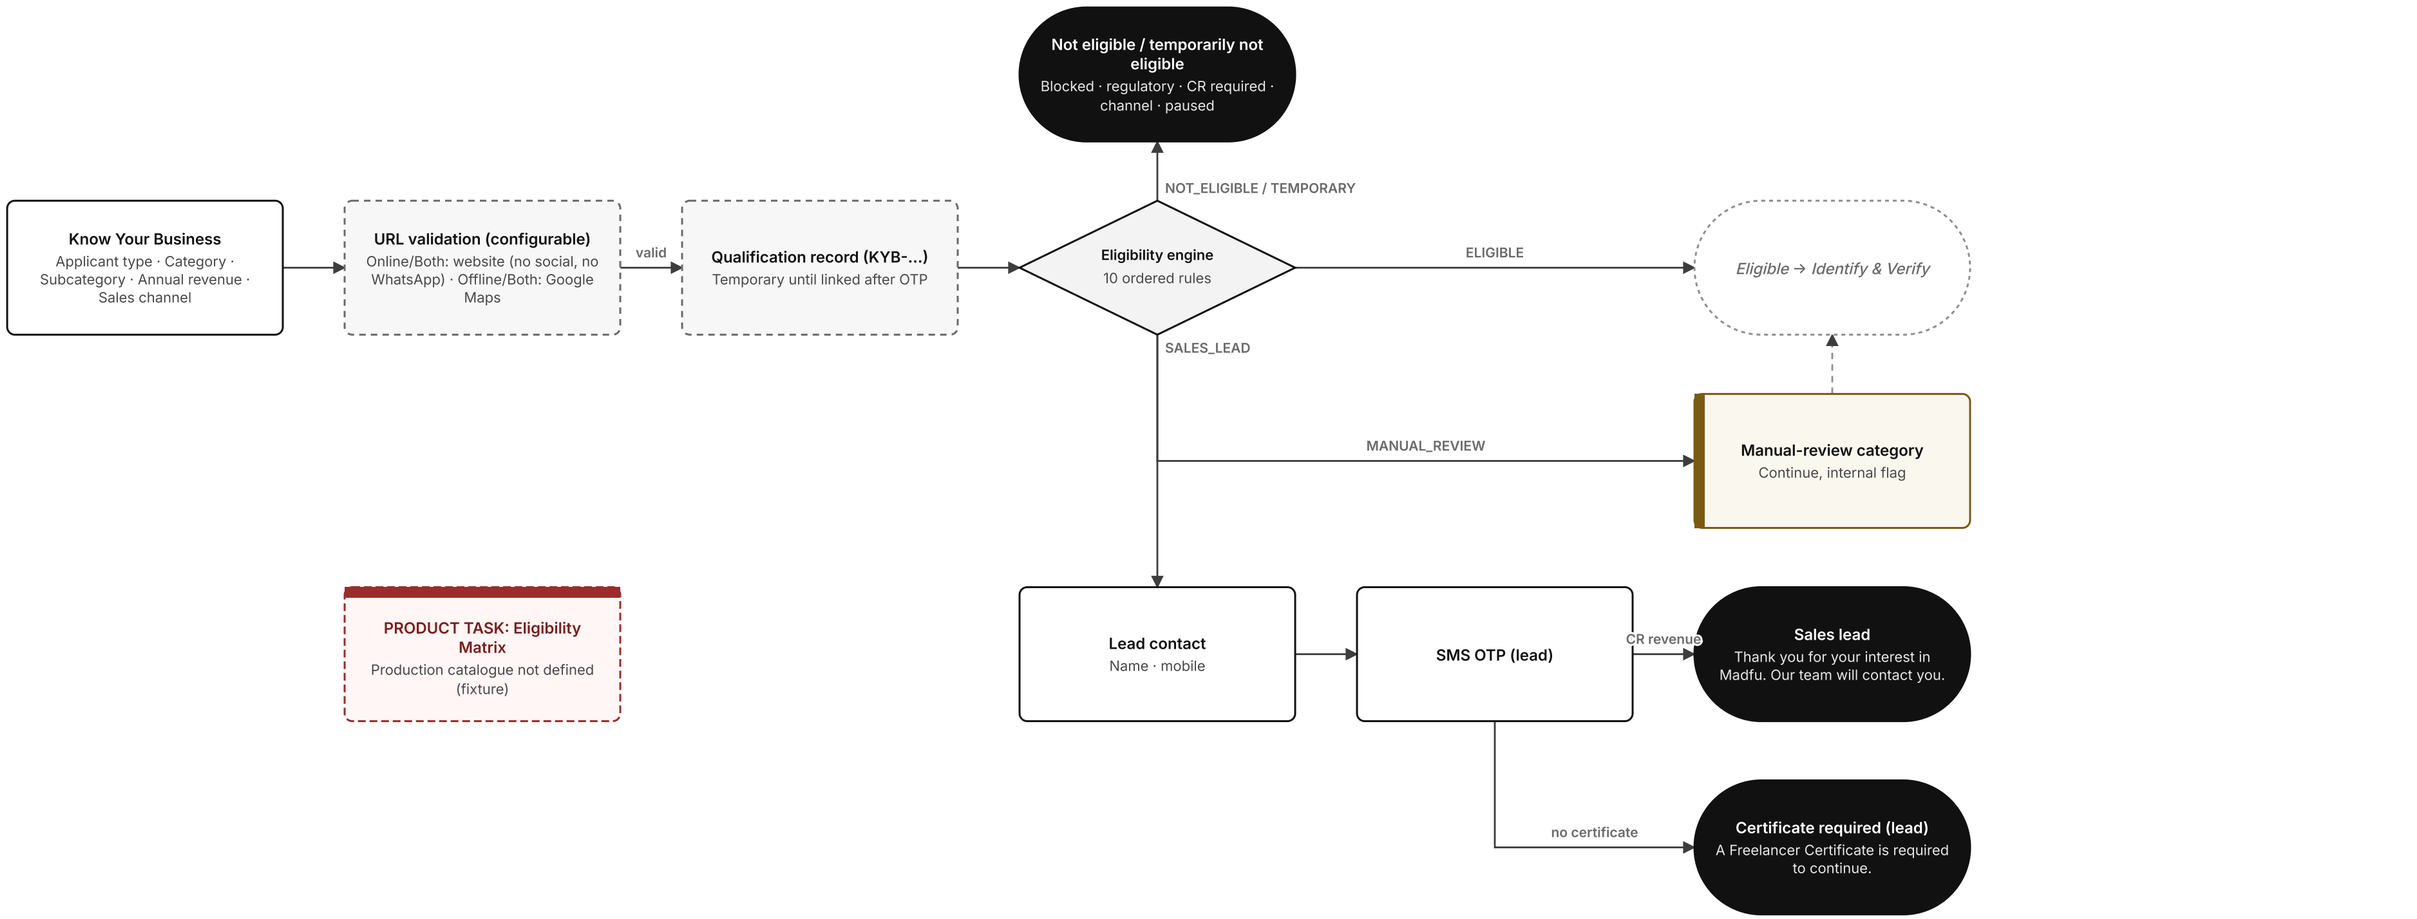

Previously verified CR / Nafath / IBAN data is reused. Resume normally triggers OTP only.

Proposed / Product Design

A · Know Your Business and eligibility

First page. No CR, National ID, mobile or OTP. Eligibility is evaluated internally before any paid verification.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

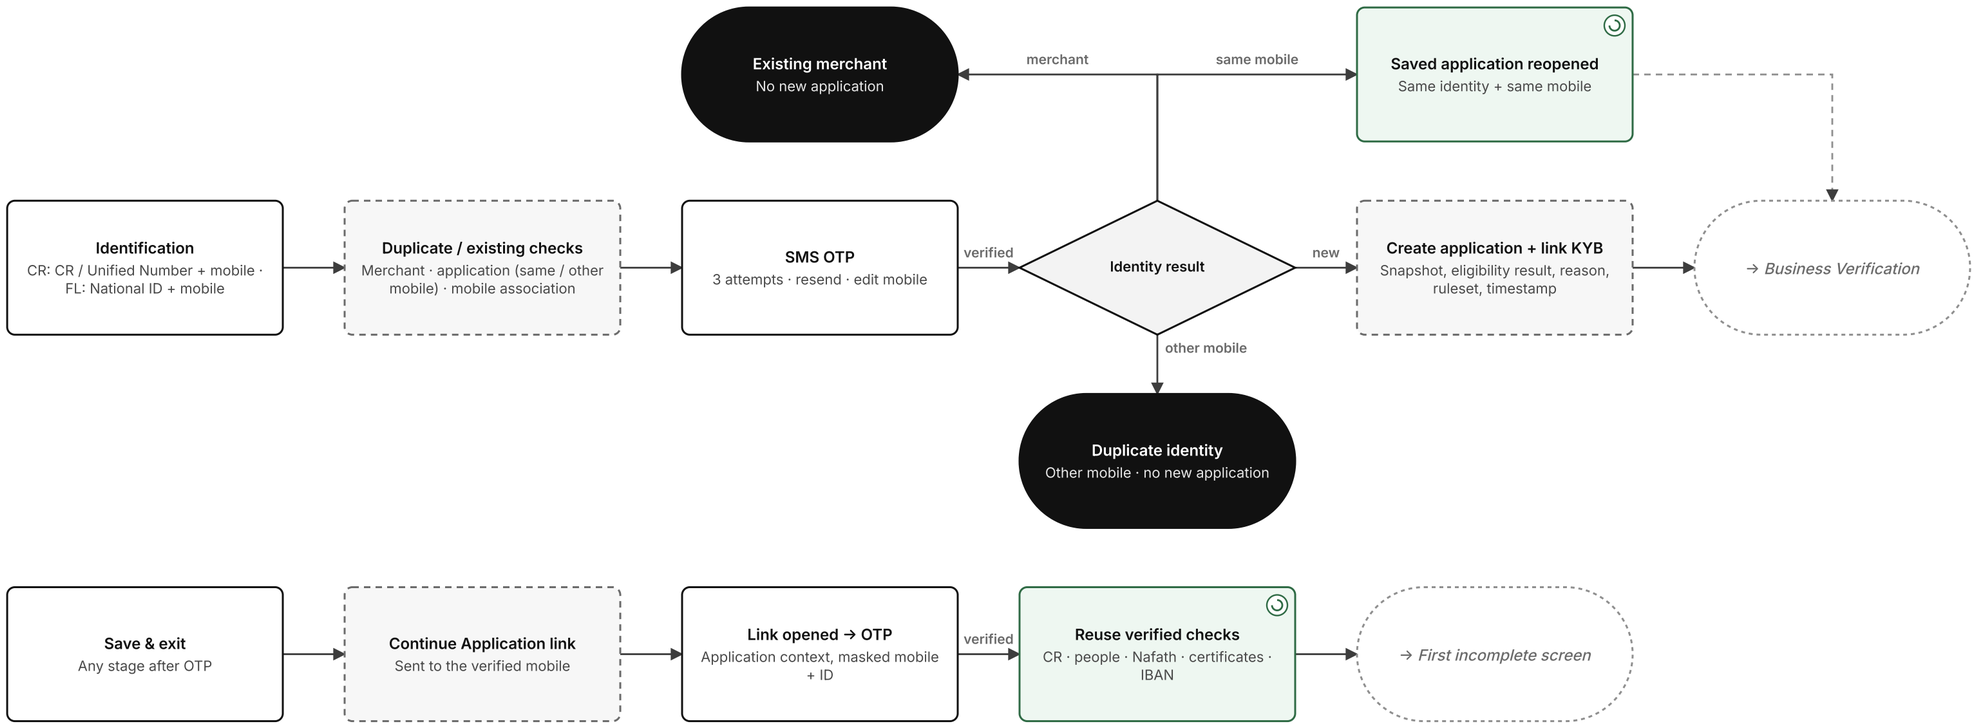

Proposed / Product Design

B · Identify & Verify, duplicates and resume

Identity after eligibility. The Continue link identifies the application; OTP authorises it. Resume goes to the first incomplete screen.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

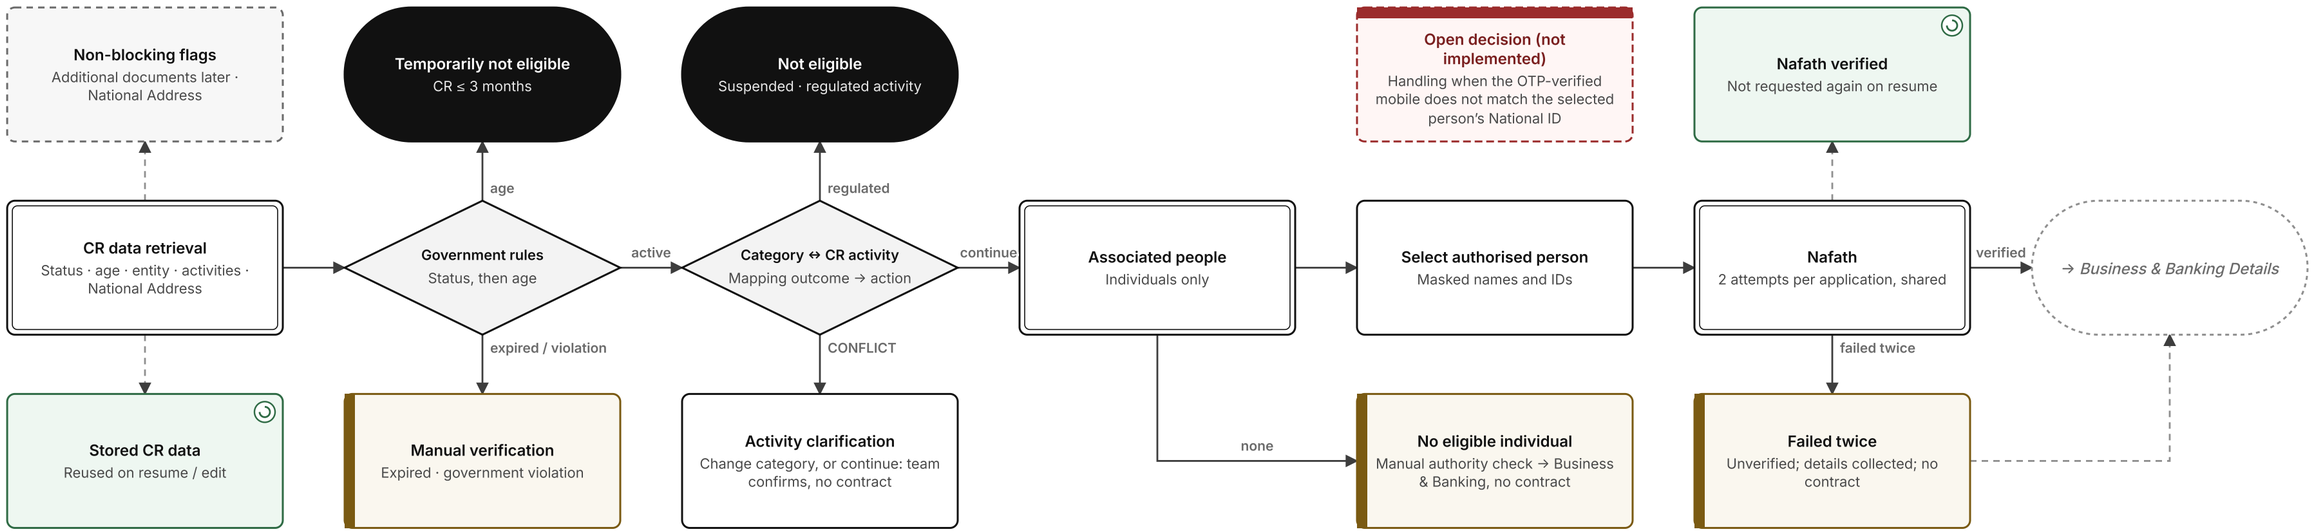

Previously verified CR / Nafath / IBAN data is reused. Resume normally triggers OTP only.

Proposed / Product Design

C1 · Business Verification: Registered business

Government data is retrieved once and reused. CR 3 months or younger: temporarily not eligible. Declared category is reconciled with the registered activity.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

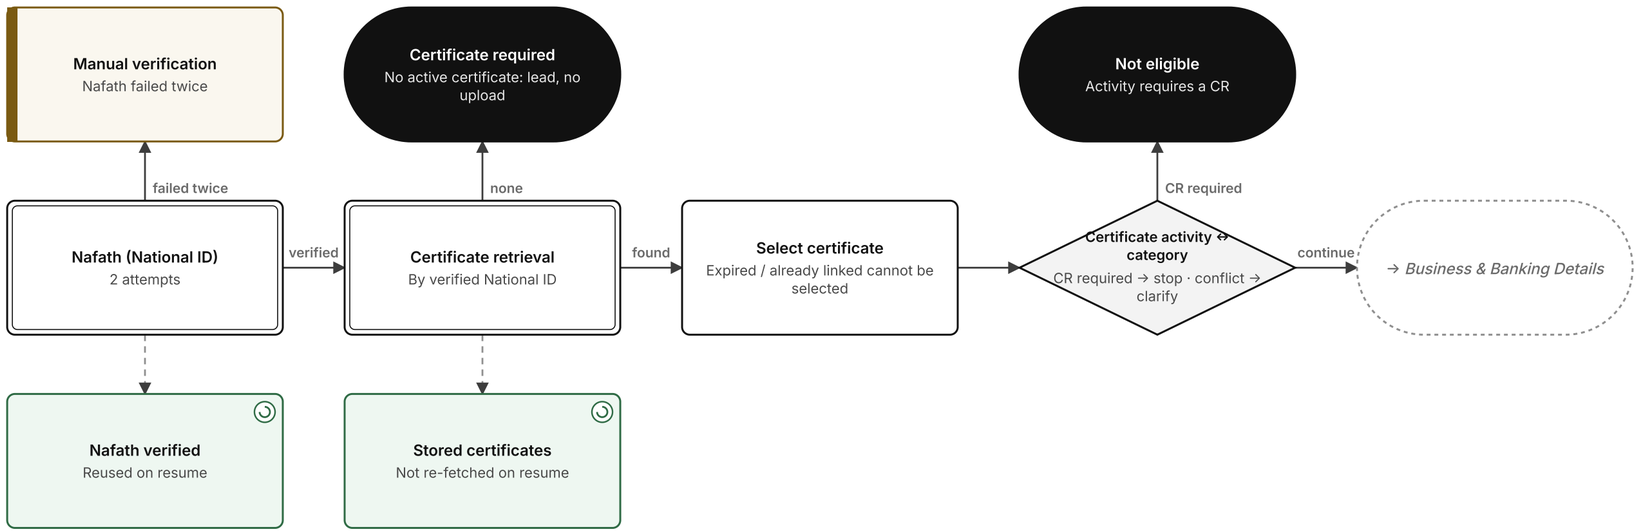

Proposed / Product Design

C2 · Business Verification: Freelancer

Nafath on the National ID, then the certificates are retrieved (never uploaded). Zero documents.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

D · Business & Banking Details

Proposed / Product Design

Stage-1 answers are shown, not asked again. Only remaining details. IBAN ownership checked once; reused until the IBAN or its owner changes.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

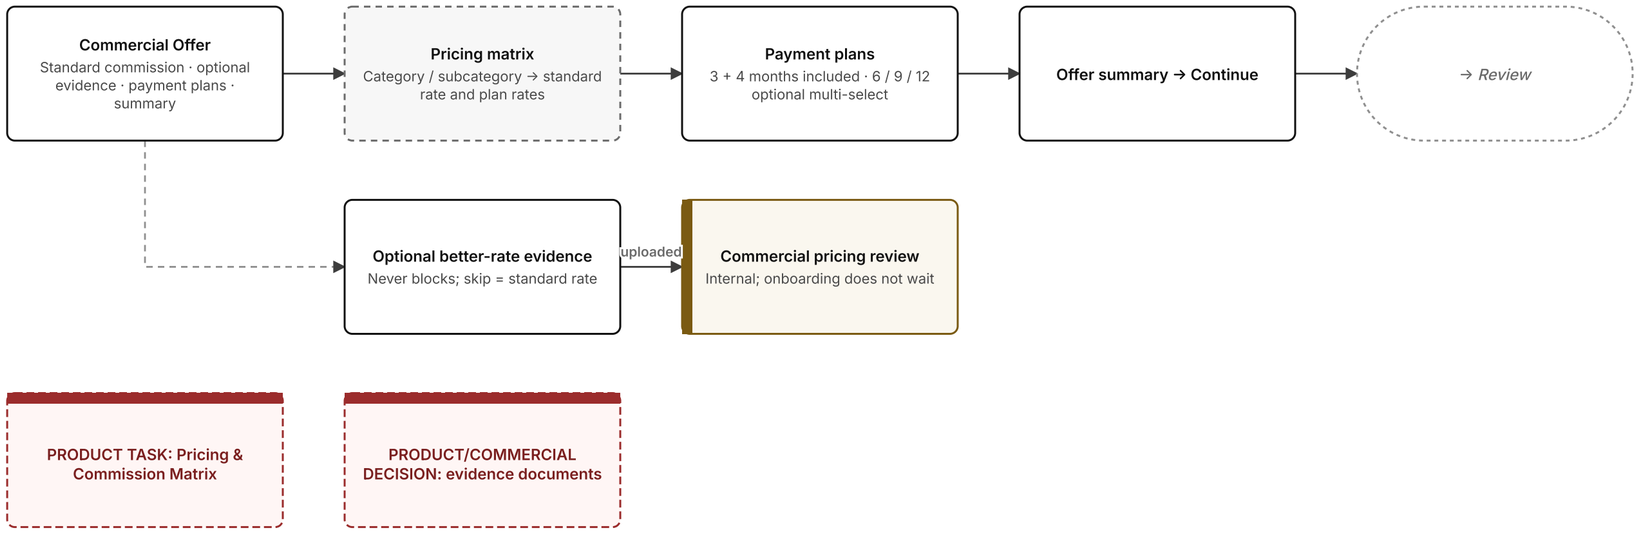

Proposed / Product Design

E · Commercial Offer

All commercial configuration lives here, not in the Contract. Standard commission comes from the pricing matrix; declared revenue never lowers it automatically.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

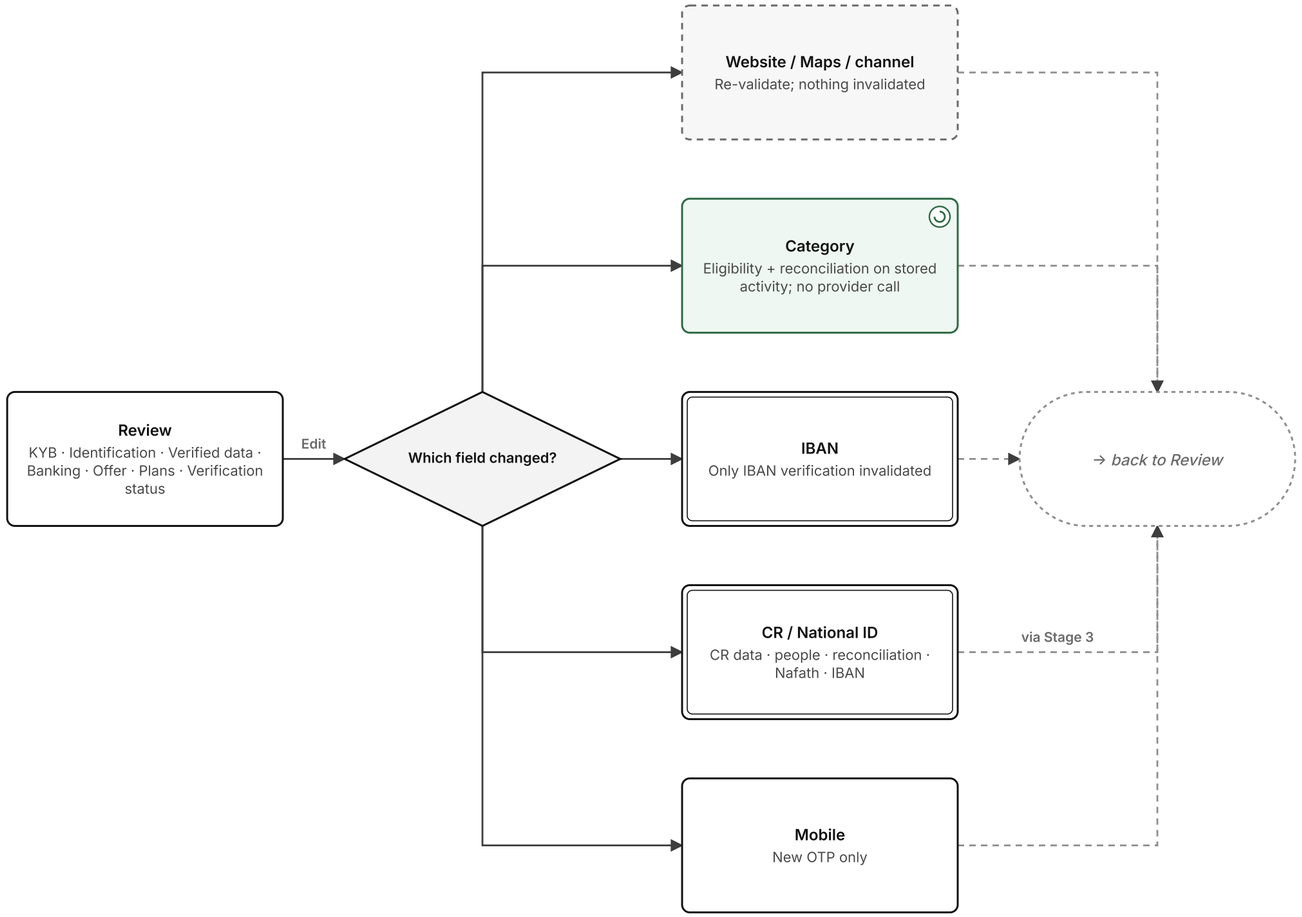

Proposed / Product Design

F · Review, Edit and dependency invalidation

Every section has Edit and returns to Review. An edit invalidates only the verification that depends on the changed field.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

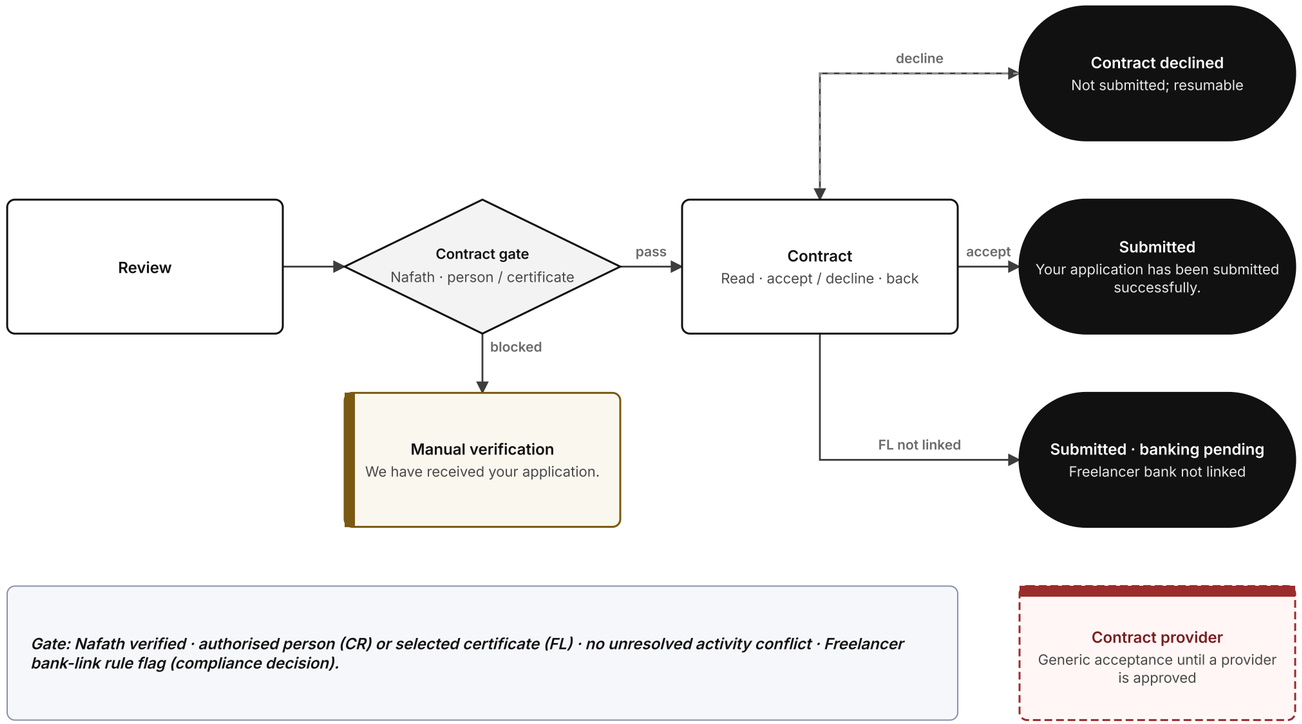

Proposed / Product Design

G · Contract and Submit / Outcome

The contract page contains the contract only: agreed commission and plans are shown as contract content, never selected here. Nafath is not the contract provider.

User-facing page · Backend decision · Internal backend step · External provider check · Cached / reused verification · Manual route · Final outcome · Open product / compliance decision · Fallback / reuse / loop

Gate: Nafath verified · authorised person (CR) or selected certificate (FL) · no unresolved activity conflict · Freelancer bank-link rule flag (compliance decision).

Contract provider
Generic acceptance until a provider is approved

Proposed / Product Design

Open product and compliance decisions

Product tasks and decisions. Not confirmed rules.

---

1. PRODUCT TASK **Define the full Eligibility Matrix** — Category · subcategory · applicant type · sales channel · revenue band · result · CR / certificate required · manual review · regulatory restriction · reason code · rule version.
2. PRODUCT TASK **Define the Pricing & Commission Matrix** — Category · subcategory · merchant / revenue tier · tenure · standard commission · improved / negotiated logic · proof requirement · effective date / version.
3. PRODUCT TASK **Define Category/Subcategory ↔ CR Activity mapping** — MATCH / COMPATIBLE / AMBIGUOUS / CONFLICT / UNMAPPED per pair, and the action for each (continue, manual review, stop, clarification).
4. PRODUCT TASK **Complete the Onboarding Decision & Validation Inventory** — Every rule from merchant input, government CR data, National Address, freelancer data, regulation, Madfu policy, categories, CR activities / age / status, legal entity, nationality, violations, banking, sales channel. Per rule: source, field, condition, type, regulatory / business / internal, stage, blocking, user message, internal status, manual follow-up, external-call cost, version.
5. COMPLIANCE DECISION **Freelancer linked IBAN before contract?** — Can a Freelancer sign the Madfu contract before the required IBAN is linked to the Freelancer Certificate? Prototype rule flag: false (least disruptive: contract allowed, banking follow-up).
6. PRODUCT/COMMERCIAL DECISION **Optional better-pricing documents** — Which documents qualify a merchant for improved pricing. Prototype: "Revenue supporting document A / B" placeholders. Contract amendment / repricing after review also open.
7. PRODUCT/ENGINEERING DECISION **Freshness / expiry policy for stored verifications** — CR data, people, Nafath, certificates, IBAN. Prototype: "Reusable until invalidated" (no expiry) for all.
8. PRODUCT / COMPLIANCE DECISION **Mobile ownership vs selected authorized person** NOT IMPLEMENTED — DECISION REQUIRED — Registered business: what should happen if the OTP-verified mobile number is not associated with the National ID of the CR owner / authorized person selected for Nafath? The prototype has no logic for this: it does not block, call a provider, show a message or change Nafath.
   - Is mobile ↔ National ID ownership matching required?
   - At what stage should it be checked?
   - Is it regulatory, risk, or Madfu business policy?
   - Does a mismatch block self-onboarding?
   - Can another owner be selected?
   - Does it route to manual verification?
   - Can Nafath itself provide sufficient identity assurance?
   - Which provider / data source should perform the match?
   - Is the verification paid?
   - Can an existing result be reused on resume?
